SYSTEM AND METHOD FOR PROVIDING REA MODEL BASED SECURITY

ABSTRACT OF THE DISCLOSURE

A method of providing Resource-Event-Agent (REA) model based security includes identifying an association between a first object and a second object, where the first object is the Agent type and the second object is any REA object. Then, an association class is created for the association between the first object and the second object. The association class, for example called a Security Policy Association Class, defines security between the first object and the second object.
